SUMMARY

Final-year Computer and Communication Engineering student (AI option) at Saint Joseph University, graduating May 2027. Strong foundation in Python, machine learning and LLM integration, with a genuine interest in AI and software development. Eager to apply my skills to real-world projects and keep learning within a professional team.

EDUCATION

Master's Degree, Computer and Communication Engineering (AI option) Exp. May 2027
Saint Joseph University of Beirut

Lebanese Baccalaureate II, General Sciences 2007 – 2022
Collège de la Sainte Famille Fanar

EXPERIENCE

AI Engineering Intern — Université Saint-Joseph de Beyrouth (ESIB · ETIB · CINIA) Jun – Jul 2026
8-week summer internship, AI option · team of 6 · client: the ETIB interpreting department

- Designed, developed and deployed an LLM-powered self-training platform, taking it from prototype to production; it is now used at the school to generate practice speeches, read them aloud in 21 voices across Arabic, French and English, transcribe the student's interpretation, and return a structured feedback report
- Integrated the Google Gemini LLM through its REST API so a single request returns the speech, summary, quiz and glossary as structured JSON consumed directly by the application's business logic
- Engineered prompts and safeguards that translate ten business requirements from the client department into one prompt, keeping output on-topic and within target length to reduce off-topic and unreliable responses
- Validated output quality by checking the trilingual glossary against UN and EU terminology databases, refining features from client feedback

Intern — Ingram Micro Levant Aug 2026

- Rotated across infrastructure, cybersecurity, networking and presales teams, seeing how enterprise IT solutions are scoped and delivered
- Practiced network architecture design and security fundamentals (access control, EDR, DLP, SOC concepts) through hands-on labs and simulations

TECHNICAL SKILLS

Programming Languages: Python, Java, C++

LLM & AI Agents: LLM API integration (Gemini, Groq), prompt engineering, AI agents & tool-calling (MCP), structured JSON outputs, running local LLMs (Ollama)

Machine Learning: scikit-learn, XGBoost, LightGBM, Pandas, NumPy, model evaluation, text classification

Automation & APIs: n8n workflow automation, REST APIs, webhooks

Tools: Git, Linux, Jupyter Notebooks

PROJECTS

AI Medical Article Detector Aug 2026

- Built an automated LLM-powered workflow in n8n that ingests newly published medical research daily, analyzes each article with rule-based checks and the Groq LLM, and flags content likely to be AI-generated
- Designed the end-to-end architecture with webhook triggers, REST API integrations and automated scheduling, and deployed a live web dashboard and daily email reports for real-time monitoring of results

Intrusion Detection System (ML) April 2024

- Trained and evaluated 8 ML models (LR, RF, XGBoost, LightGBM, MLP, Stacking Ensemble) on 2.9M IoT network traffic samples, comparing performance metrics to select the best model for 34 attack types
- Deployed the selected model as a real-time detection API that identifies malicious IoT traffic, including DoS, DDoS and injection attacks

AI Penetration Testing Agent (Local LLM + MCP) Nov 2026

- Ran a local LLM (Qwen 2.5 14B via Ollama) fully offline and connected it to security tooling through the Model Context Protocol (MCP), so the agent executed tools from natural-language objectives on Kali Linux
- Built and evaluated the agent in an isolated lab with a human-approval gate on every action, and documented the confidentiality, auditability and governance trade-offs of a fully local AI-agent deployment

LANGUAGES

Arabic (Native) | English (Fluent) | French (Fluent)
